

Using tDCS in Speech-Based Stroke Rehabilitation

Clinical Trial

In Progress/Currently Recruiting Participants

For more information, please contact suw2007@med.cornell.edu or call (914) 597-2137 for a free consultation.

BNI Investigator:
Susan Wortman-Jutt, M.S., CCC-SLP
Speech-Language Pathologist
Research Associate

Principal Investigator:
Adam Buchwald, Ph.D.
Associate Professor
Communicative Sciences and Disorders,
New York University Steinhardt

What Do We Do?

Qualifying participants who have had a stroke and have apraxia of speech will receive up to 24 speech therapy sessions over a 4 to 6 month period, at no charge.

Transcranial direct current stimulation (tDCS), a form of non-invasive brain stimulation, will also be used during a portion of speech therapy. tDCS is considered a non-risk device by the FDA, and is safe to use. Low doses of electrical current will be administered through the scalp over areas that may assist with speech recovery.
